Using the latest in 3D printing technology, this new cloud based solution will be available to patients, doctors, students and researchers as an on-demand service with a range of free educational tools. The concept of the BioDigital Human will revolutionise healthcare by enabling patients to see themselves in a new way, in full colour and with a degree of reality that cannot be achieved by any other means. Our BioDigital Human concept is unique to Voxel Digital Solutions and is one of our primary focus areas for the creation of a new business entity. Having successfully built a similar concept in China, we have the experience, knowledge, contacts and expertise to realise this with confidence. Our unique solution will combine the 3D human anatomy with a real-time medical file, and using a colour matching feature, allow for fast matching with a human patient. With this technology, a patient who has had a recent surgery or has had a procedure, such as cosmetic surgery or a transplant, will be

able to view a highly realistic model of their own anatomy using a range of computerised surgical tools. With this combination of 3D human anatomy with real-time medical files, using advanced 3D printing, the BioDigital Human will change the way that patients and doctors interact in healthcare. Voxel Digital Solutions have just appointed one of the highest profile partners to the company, Dr. David Benfield, lead orthopaedic surgeon at Southampton General Hospital in Southampton. The BioDigital Human has received an initial £200,000 investment from The Big Lottery Fund's Health Innovation Business Accelerator, bringing the total investment to £300,000. Once the product is ready for launch, it will be free to use for patients and healthcare professionals. The product will be available on the BioDigital Human site, where users will have the opportunity to view a range of anatomical structures, disease and treatment. The BioDigital Human will have a range of free educational tools available. The concept is very simple, but the goal of our business is to make this concept easy and fun to use. This is not a traditional 3D modelling product, but a cloud based digital product using 3D printing. The software is fully flexible, yet very easy to use and requires very little input from the end user. Using the latest in 3D printing technology, this new cloud based solution will be available to patients, doctors, students and researchers as an on-demand service with a range of free educational tools.
